SUPPORTING INFORMATION

Bayesian estimation of the global biogeographical history of the Solanaceae

Julia Dupin, Nicholas J. Matzke, Tiina Särkinen, Sandra Knapp, Richard G. Olmstead, Lynn Bohs and Stacey D. Smith

Appendix S2. Solanaceae phylogeny with Maximum Likelihood ancestral range estimates.

Maximum likelihood, ancestral range estimates under the best model, DEC+*j*+*w*, on Solanaceae (outgroups not shown). The relative probability of the estimated ranges are represented in pies at the nodes. Dotted, vertical lines mark the three time strata used in the dispersal matrices (Appendix S1). Colours in this figure are equivalent to colours in Appendix S3.

Colour legend for single, two and three-area ranges that are frequent on the plot. Other colours represent combinations of the primary area colours.

S, South America; C, Central America; B, Caribbean; N, North America; A, Africa; E, Eurasia; O, Australia
